

ARDAC Kidney Health Study

Screening Report

Dubbo & Gulargambone Area

30th August - 10th September
2010

The ARDAC Study

The ARDAC Study (**A**ntecedents of **R**enal **D**isease in **A**boriginal **C**hildren) is based at The Centre for Kidney Research at The Children's Hospital at Westmead and is investigating the early signs of kidney and cardiovascular disease in both Aboriginal and non-Aboriginal children in NSW. The first phase of the study was conducted over 6 years between 2002 and 2007 and followed the health of more than 2000 primary school children from areas across NSW. Initially participants were recruited from primary schools, however they are now screened in high schools, at home and in the community as the participants are older and some have left school. Screening in Phase 2 of the study includes measurement of height, weight, blood pressure, waist circumference and a urine test.

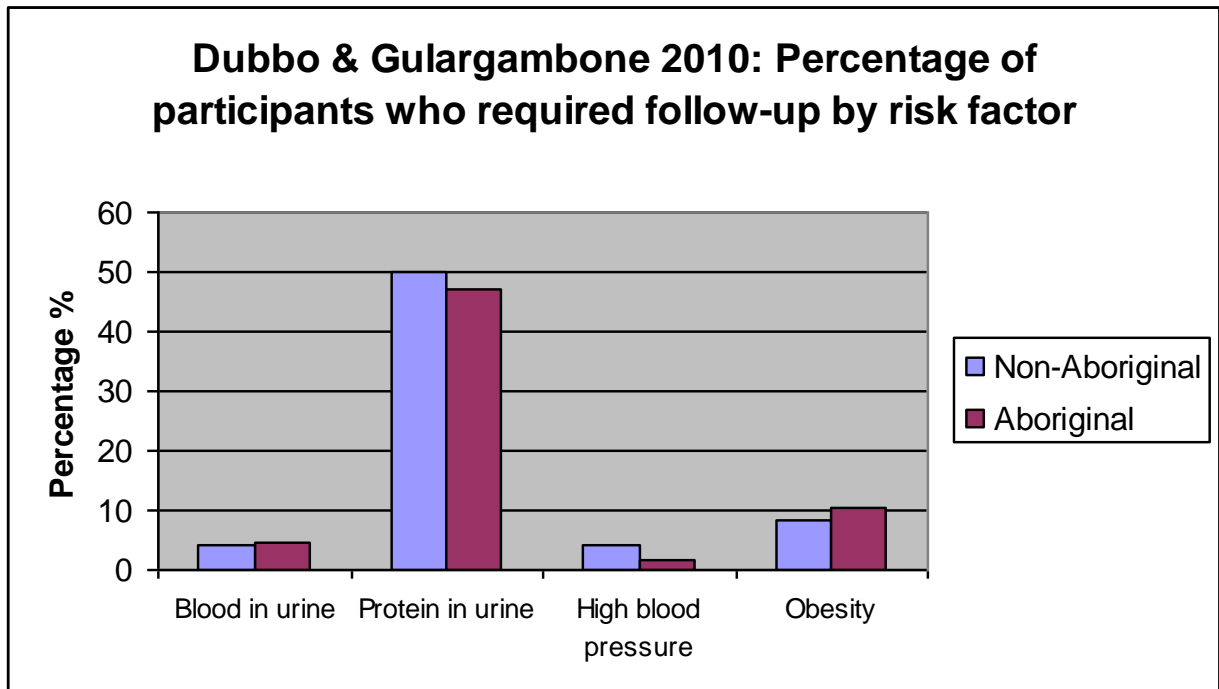

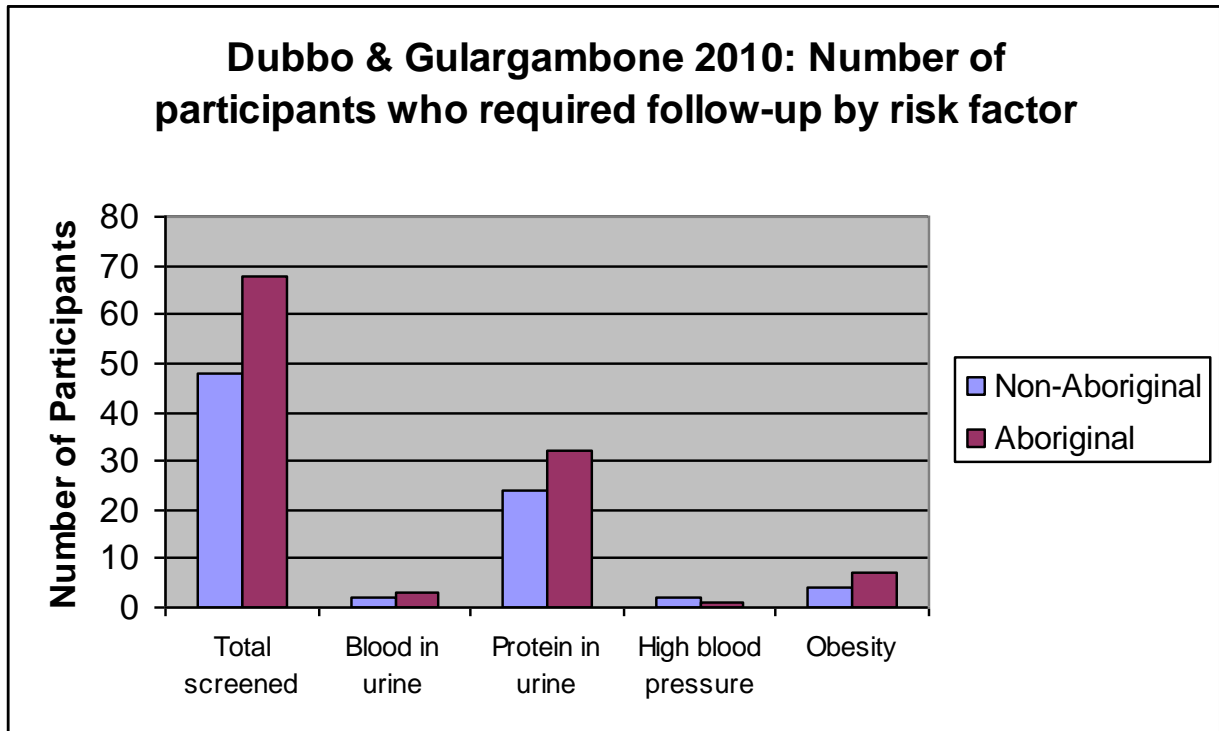

The results of the first phase showed no difference in presence of markers for kidney and cardiovascular disease between Aboriginal and non-Aboriginal participants. Screening for Phase 2 started in 2008. The success of the ARDAC study has been the result of the support and commitment from Aboriginal Health Workers (AHW's), Aboriginal Education Officers (AEO's), teachers, staff from the Aboriginal Medical Services, the Division of General Practice and a large number of participating schools and communities.

In 2010 we screened 116 participants from the Dubbo and Gulargambone Area. These are the results of screening in the Dubbo and Gulargambone Area in 2010.

Schools screened in the Dubbo and Gulargambone Area:

School	Participants
Canobolas High School	5
Dubbo College - Delroy Campus	28
Dubbo College - Senior Campus	13
Dubbo College - South Campus	3
Gulargambone Central School	22
Kinross Wolaroi School	1
Narromine High School	1
Orange High School	13
Parkes High School	2
Peak Hill Central School	17
Warren Central School	1
Clinic Visits	2
Home Visits	8
Total	116

ARDAC Phase 2 Screening Report Dubbo & Gulargambone Area

The first graph shows the number of Aboriginal and non-Aboriginal participants who were referred for each risk factor. The second graph shows the percentage of Aboriginal and non-Aboriginal participants who were referred for each risk factor.

Number of participants tested: 116

Ethnicity: 41% non-Aboriginal (48) and 59% Aboriginal (68)

▪ **Blood in urine \geq 1+ (25 cells/uL) excluding menstruation:**

There were 5 out of 116 participants (4%) who had blood in their urine, 2 non-Aboriginal and 3 Aboriginal

▪ **Protein in urine \geq 1+ (30mg/dL):**

There were 56 out of 116 participants (48%) with protein in their urine, 24 non-Aboriginal and 32 Aboriginal

▪ **High blood pressure (systolic blood pressure $>$ 95% for age):**

There were 3 out of 116 participants (3%) with systolic hypertension, 2 non- Aboriginal and 1 Aboriginal

▪ **Obesity (Body Mass Index SDS \geq 2):**

There were 11 out of 116 participants (9%) with a BMI SDS \geq 2, 4 non-Aboriginal and 7 Aboriginal

Referral

Participants are referred to their local doctor, Aboriginal Medical Service or Community Health Centre for further investigation if one or more of the following are found during screening;

- **High blood pressure**
- **Obesity**
- **Blood, protein or albumin in their urine**

Participants who require follow-up receive instructions with their screening results.
